

EXPLANATION

- Qal** Alluvium (Holocene)—Grades from clay to gravel, consists predominantly of organic-rich silt to fine sand. The alluvium is generally represented by small discontinuous deposits within smaller river and stream beds, but can be quite extensive in the large river valleys and floodplains; also included are deposits of artificial fill and modified land.
- Qom** Vashon moraine deposits (Pleistocene)—Consist of clay, silt, sand, and gravel; also include mixtures of till and outwash not separately mappable.
- Qop** Vashon recessional outwash deposits (Pleistocene)—Moderately to poorly sorted gravel and sand with small amounts of silt and clay; include ice-contact deposits, glacial outwash alluvium and small amounts of ablation till. Qop consists of the coarser deposits and Qv consists of undifferentiated outwash deposits.
- Qot** Vashon till (Pleistocene)—Predominantly fine-grained deposits consisting of unsorted and unstratified glacial sediments from clay to boulder in size that vary in compaction and composition throughout the Puget Sound Lowland.
- Qoa** Vashon advance outwash deposits (Pleistocene)—Consist of stratified and cross-bedded gravels and coarse sands with lenses of silt and clay.
- Qos** Olympia interglacial deposits (Pleistocene)—Oxidized orange to dark red, frequently cemented pebble-to-cobble-size gravel consisting of Olympic Mountain derived basalt, gneiss, slate, and sandstone. The gravel also contains thin lenses of discontinuous silt and clay.
- Qoad** Pre-Vashon alpine glacial deposits (Pleistocene)—May also include some Olympia nonglacial deposits.
- Qob** Pre-Fraser undifferentiated glacial and nonglacial deposits (Pleistocene).
- Bk** Bedrock—Tertiary and older volcanic, metamorphic, and sedimentary rock, undifferentiated.
- Hydrogeologic contact
